What is fast timing?

Fast timing is the measuring of lifetimes of the order of hundreds of picoseconds to the order of nanoseconds .

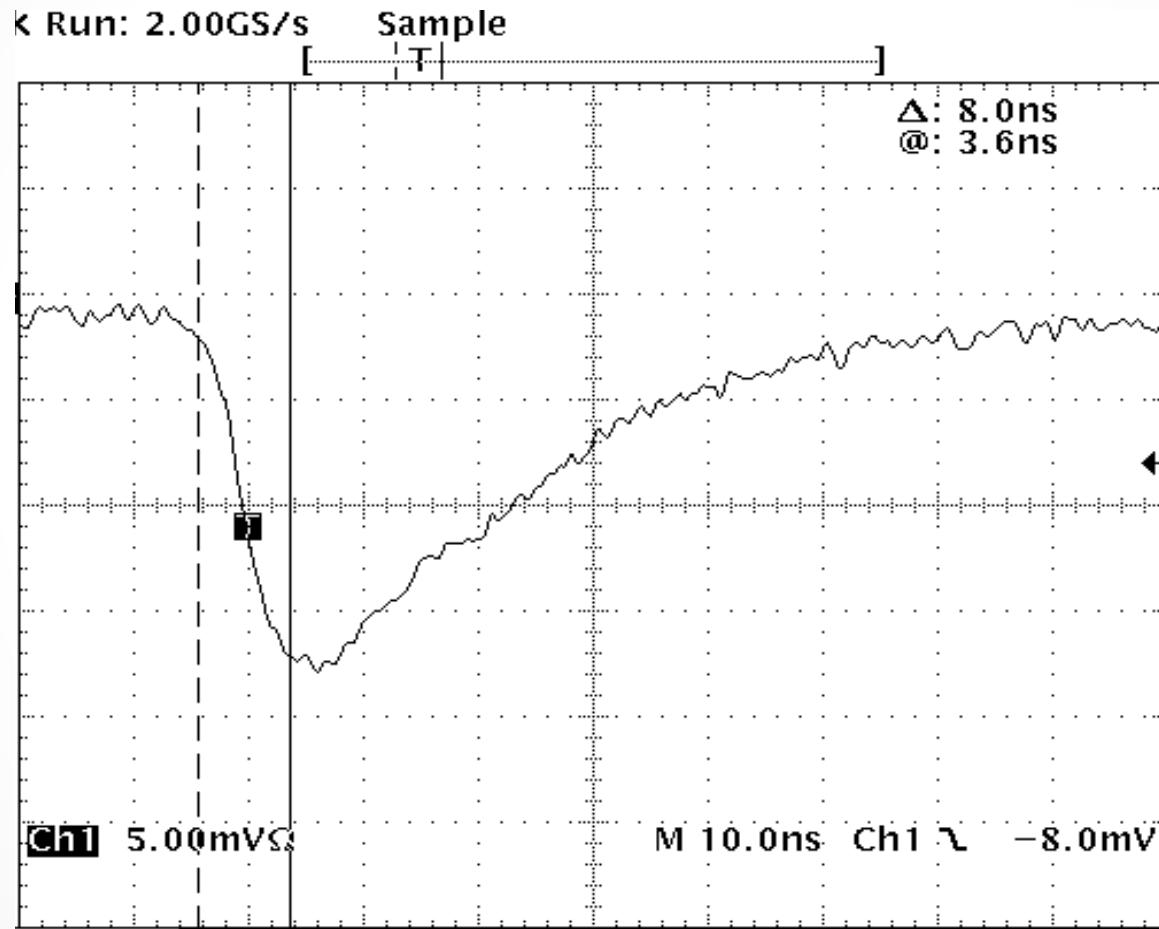

Source

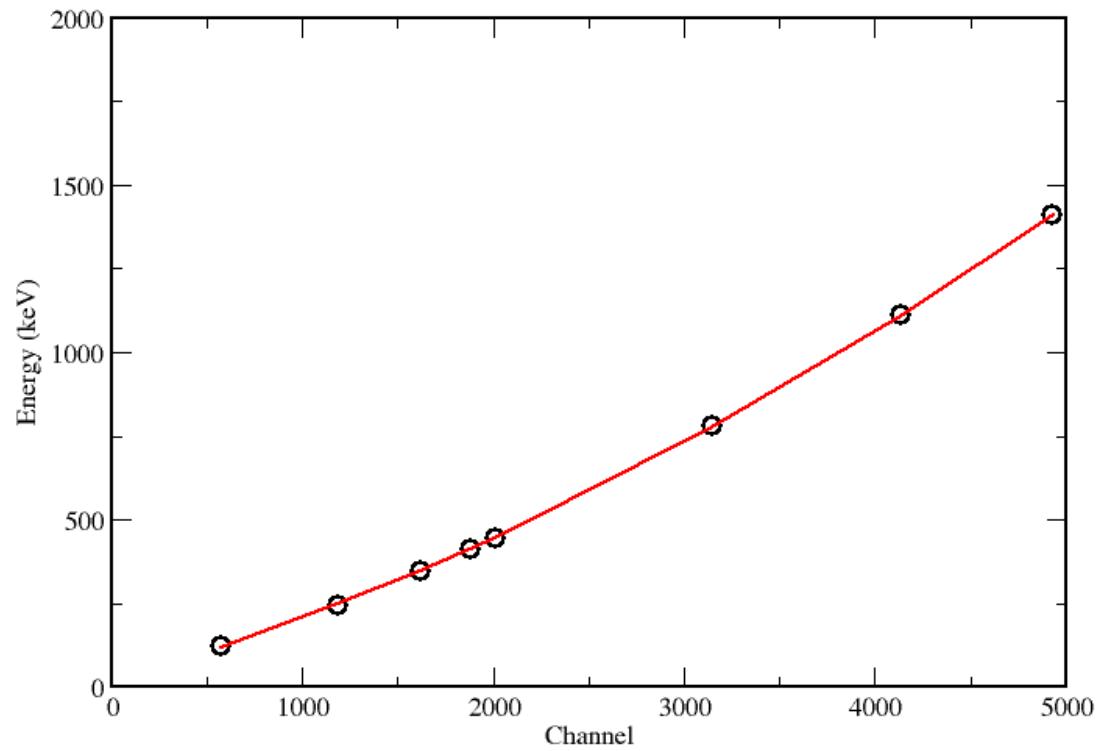

Signal from detector anode

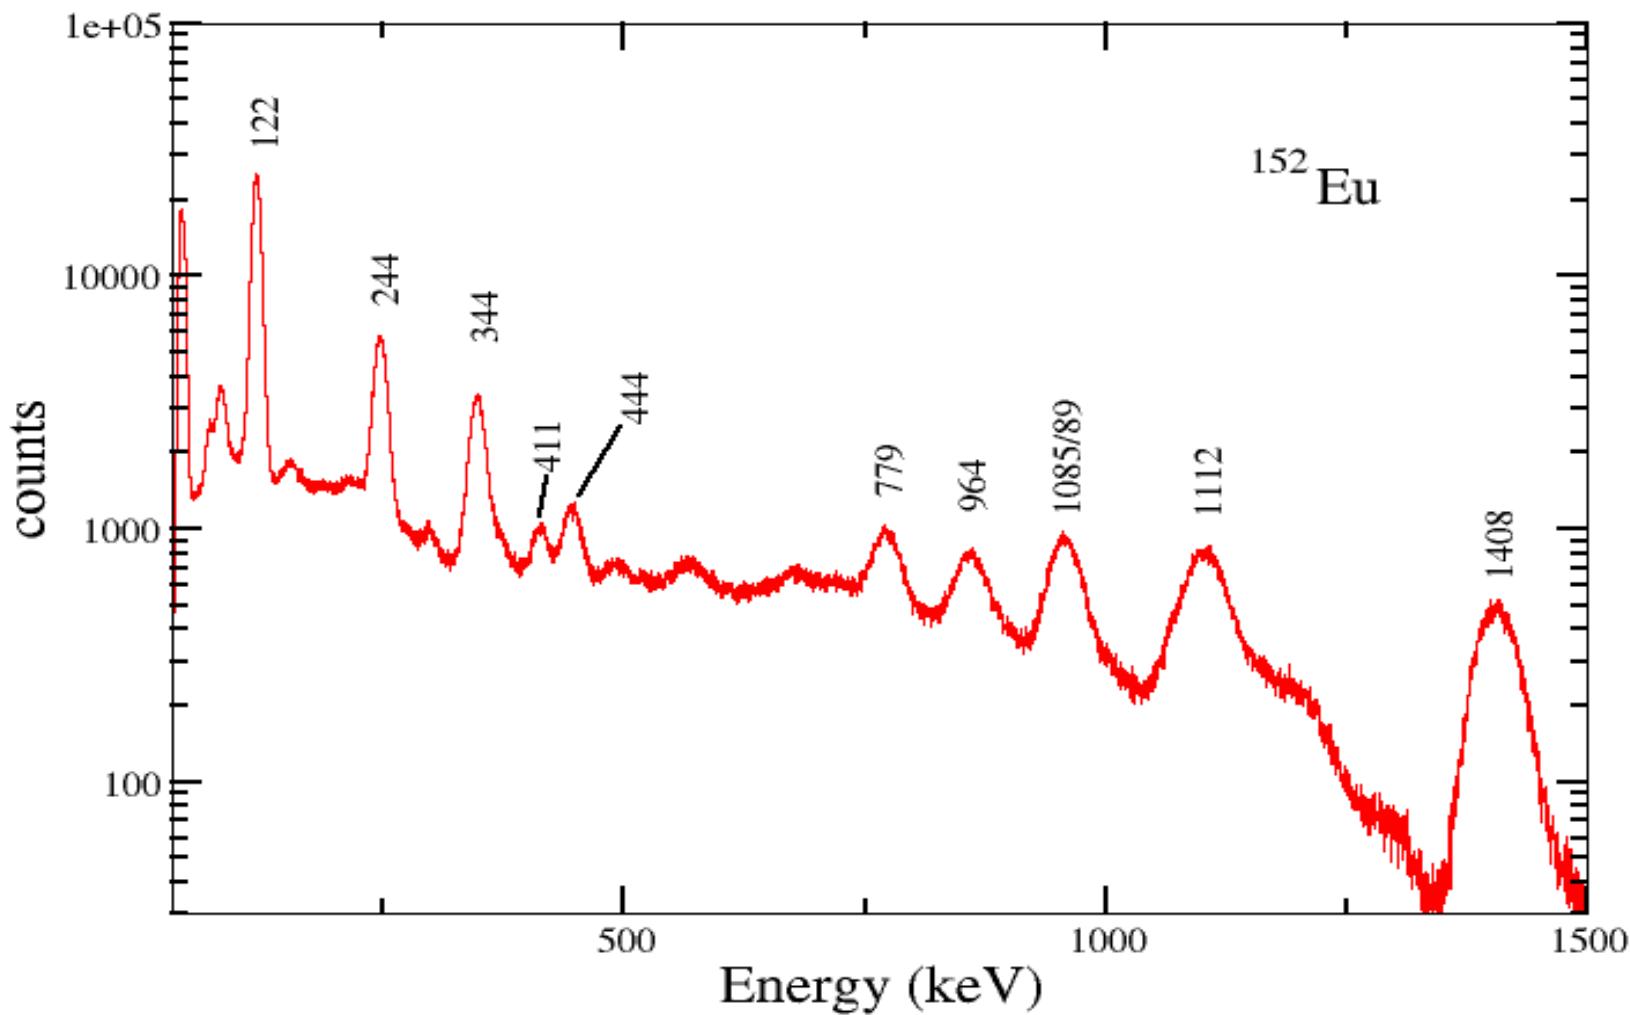

Used sources

- For energy calibration and timing - ${}^{152}\text{Eu}$
- For evaluating time resolution - ${}^{160}\text{Co}$

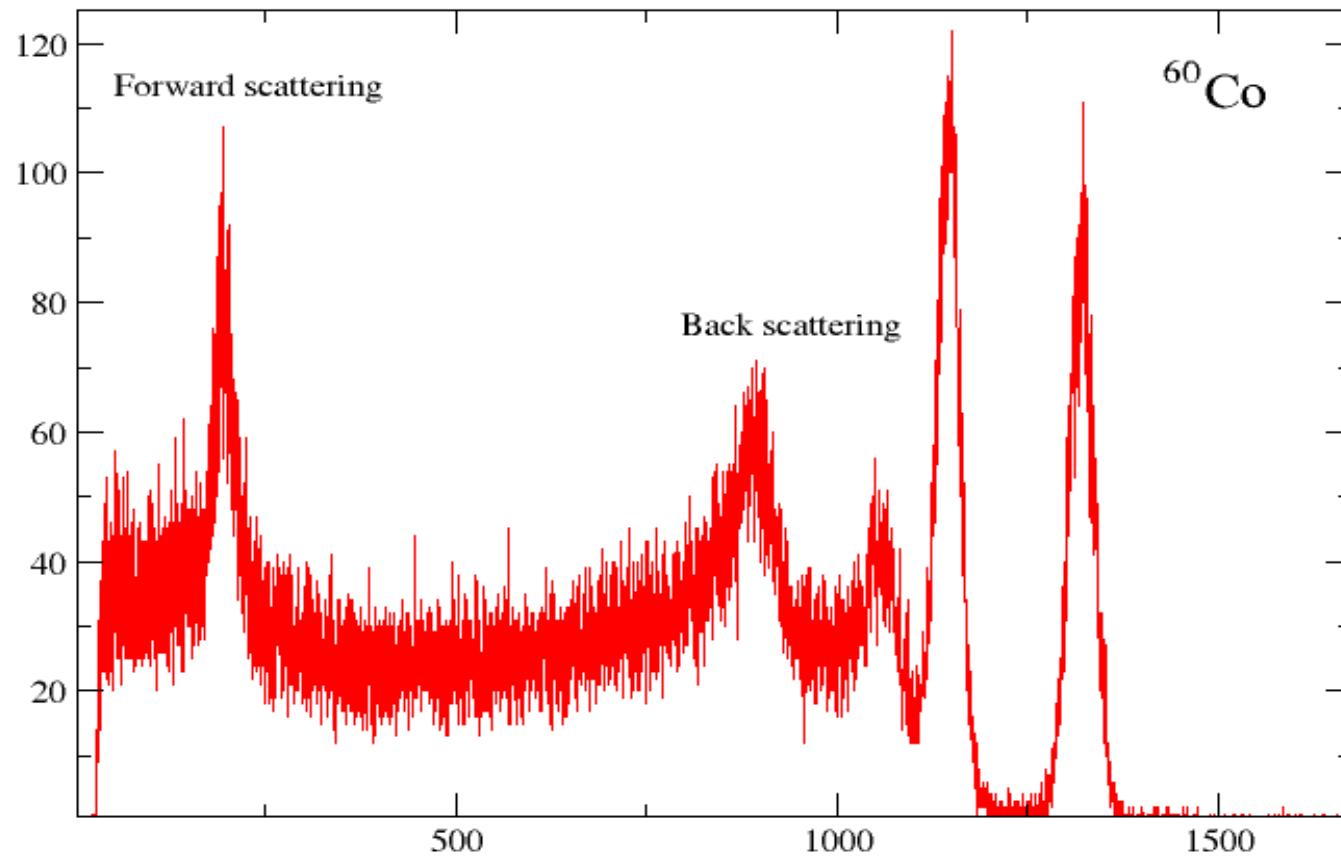

Energy Calibration

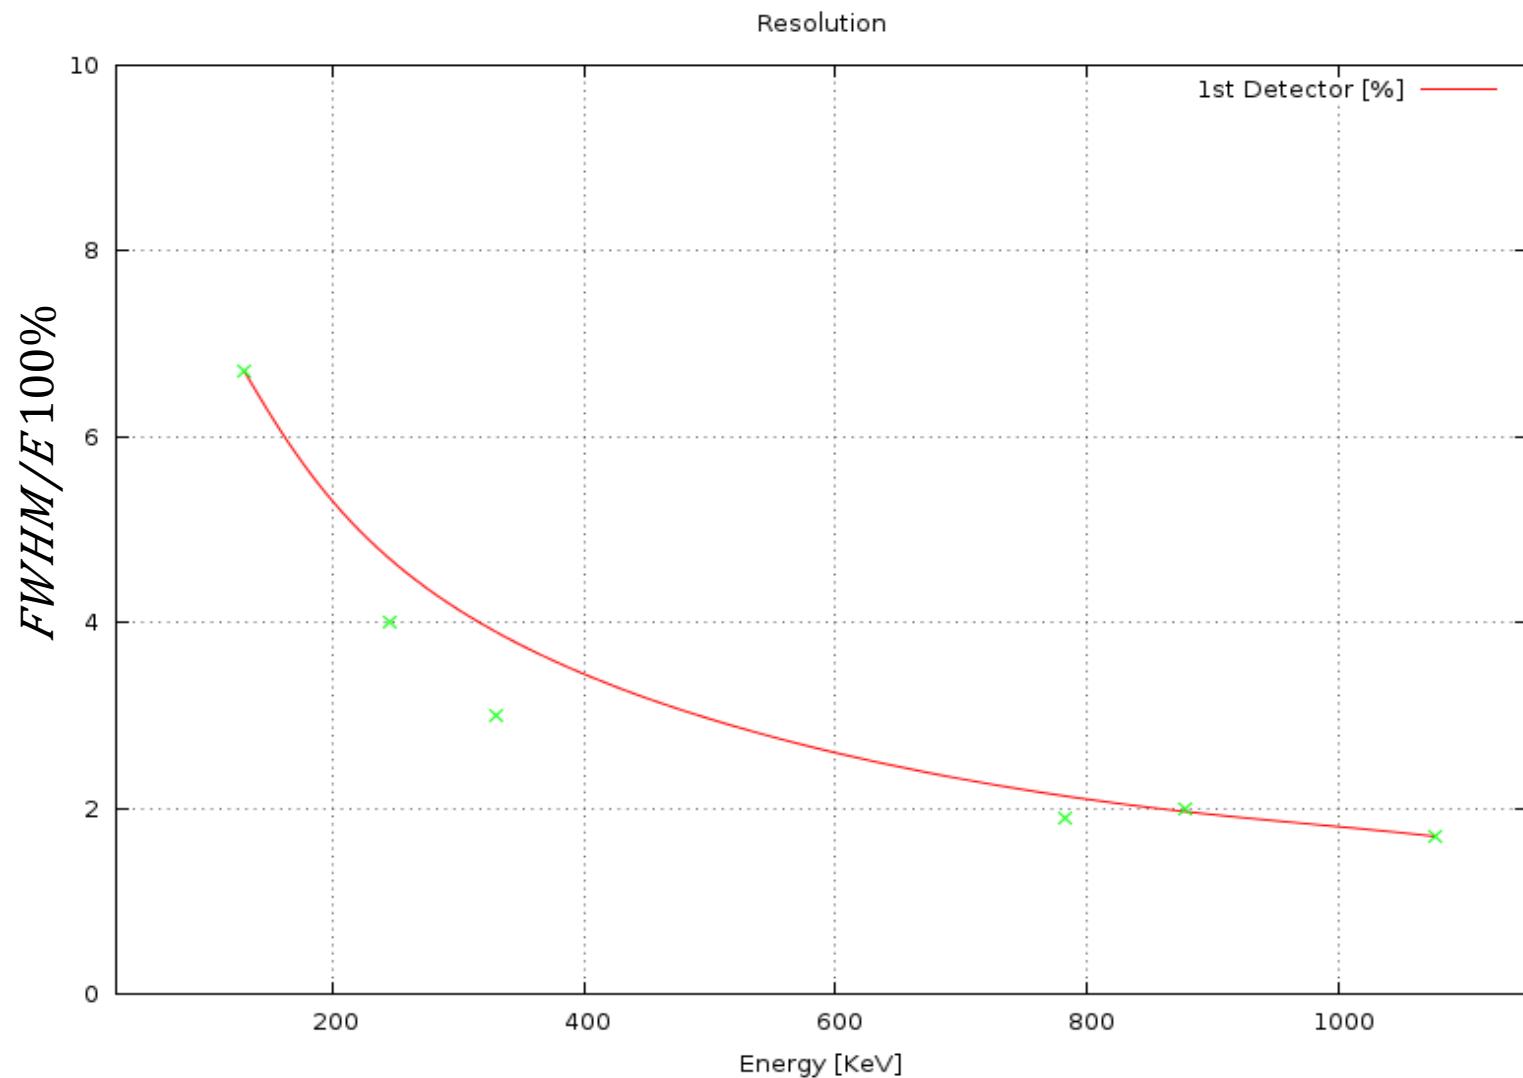

Energy Spectrum of ${}^{\gamma}152\downarrow Eu$

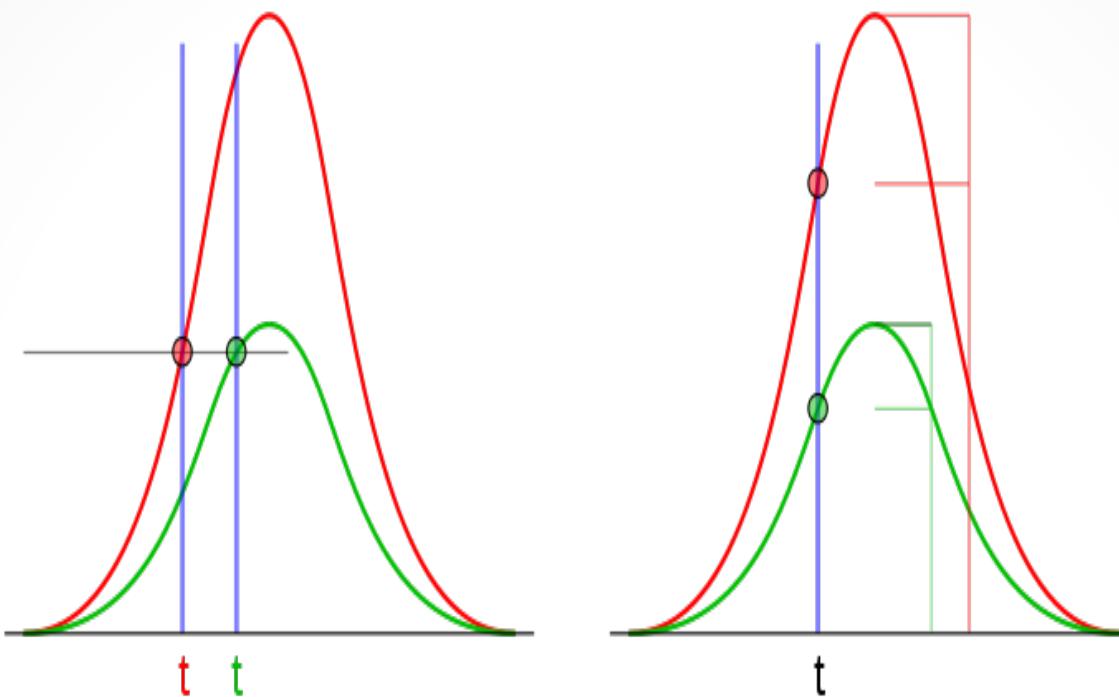

Energy Spectrum of ${}^{160}\text{Co}$

Detector Resolution

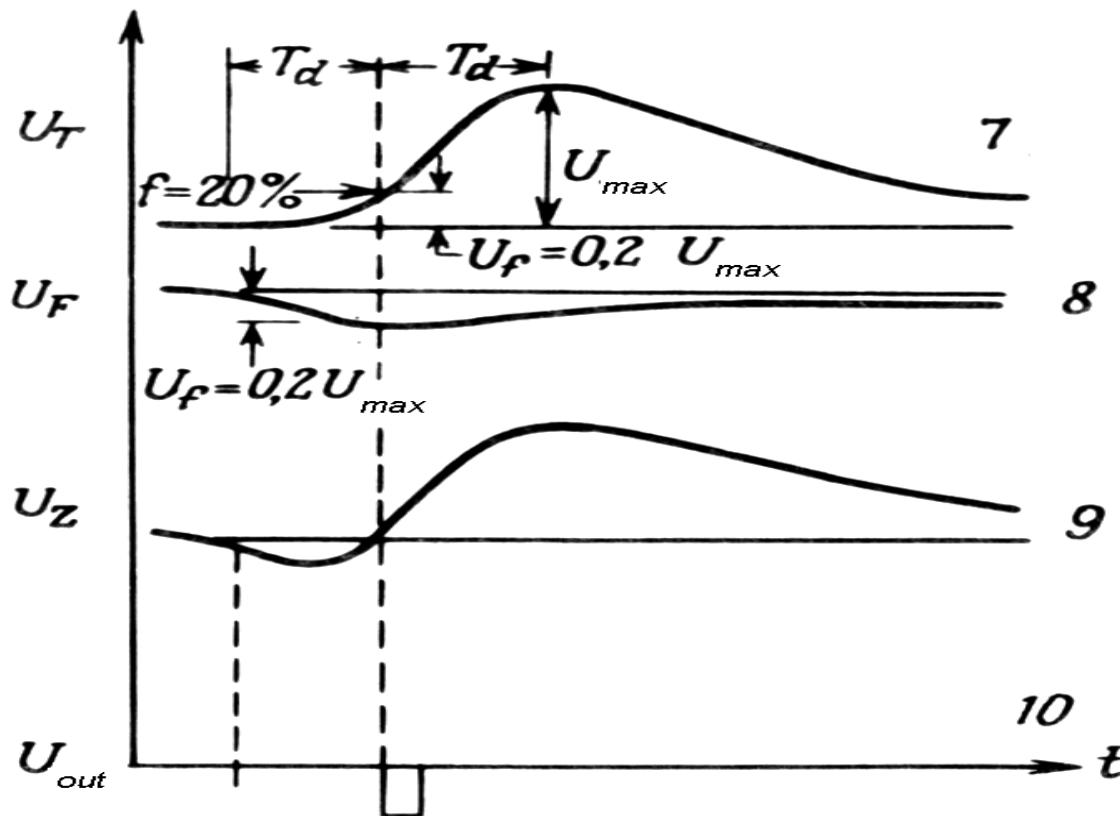

Why do we need constant fraction discriminator?

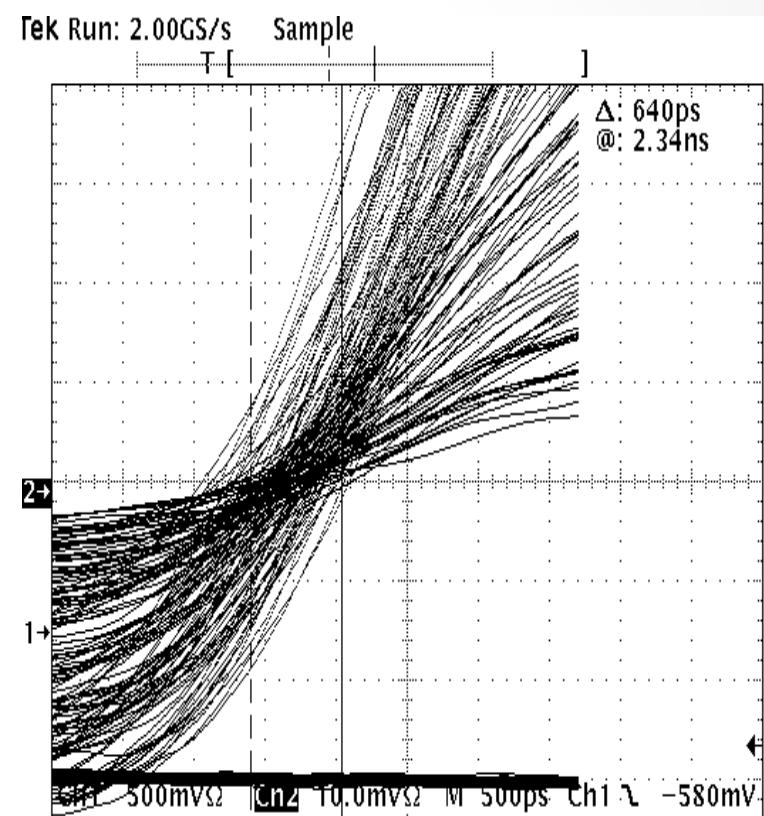

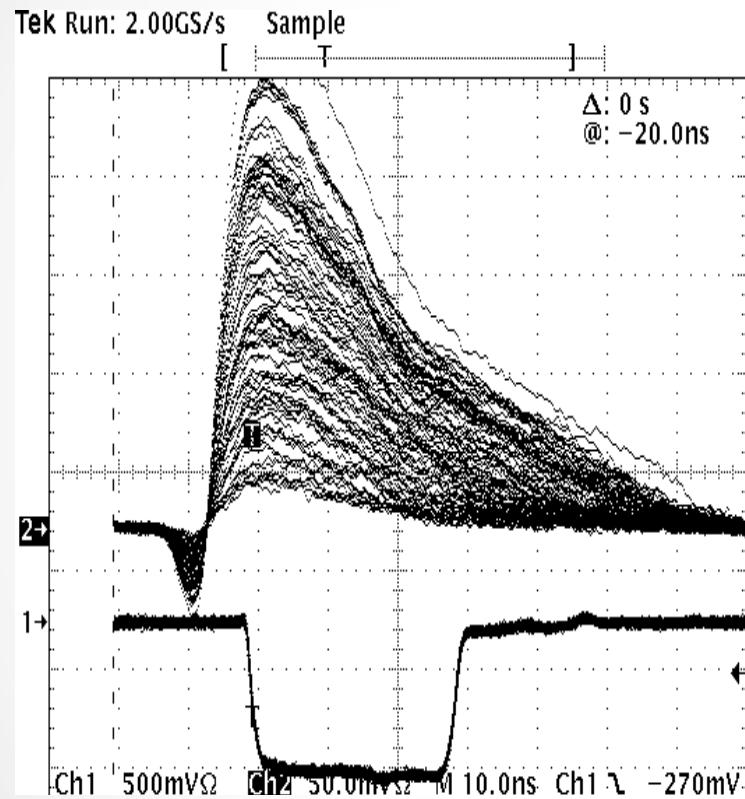

With Leading Edge Discriminator we get different times for signals coming the same time, but with different amplitudes.

Solution to the problem

Physical limitations of CFD

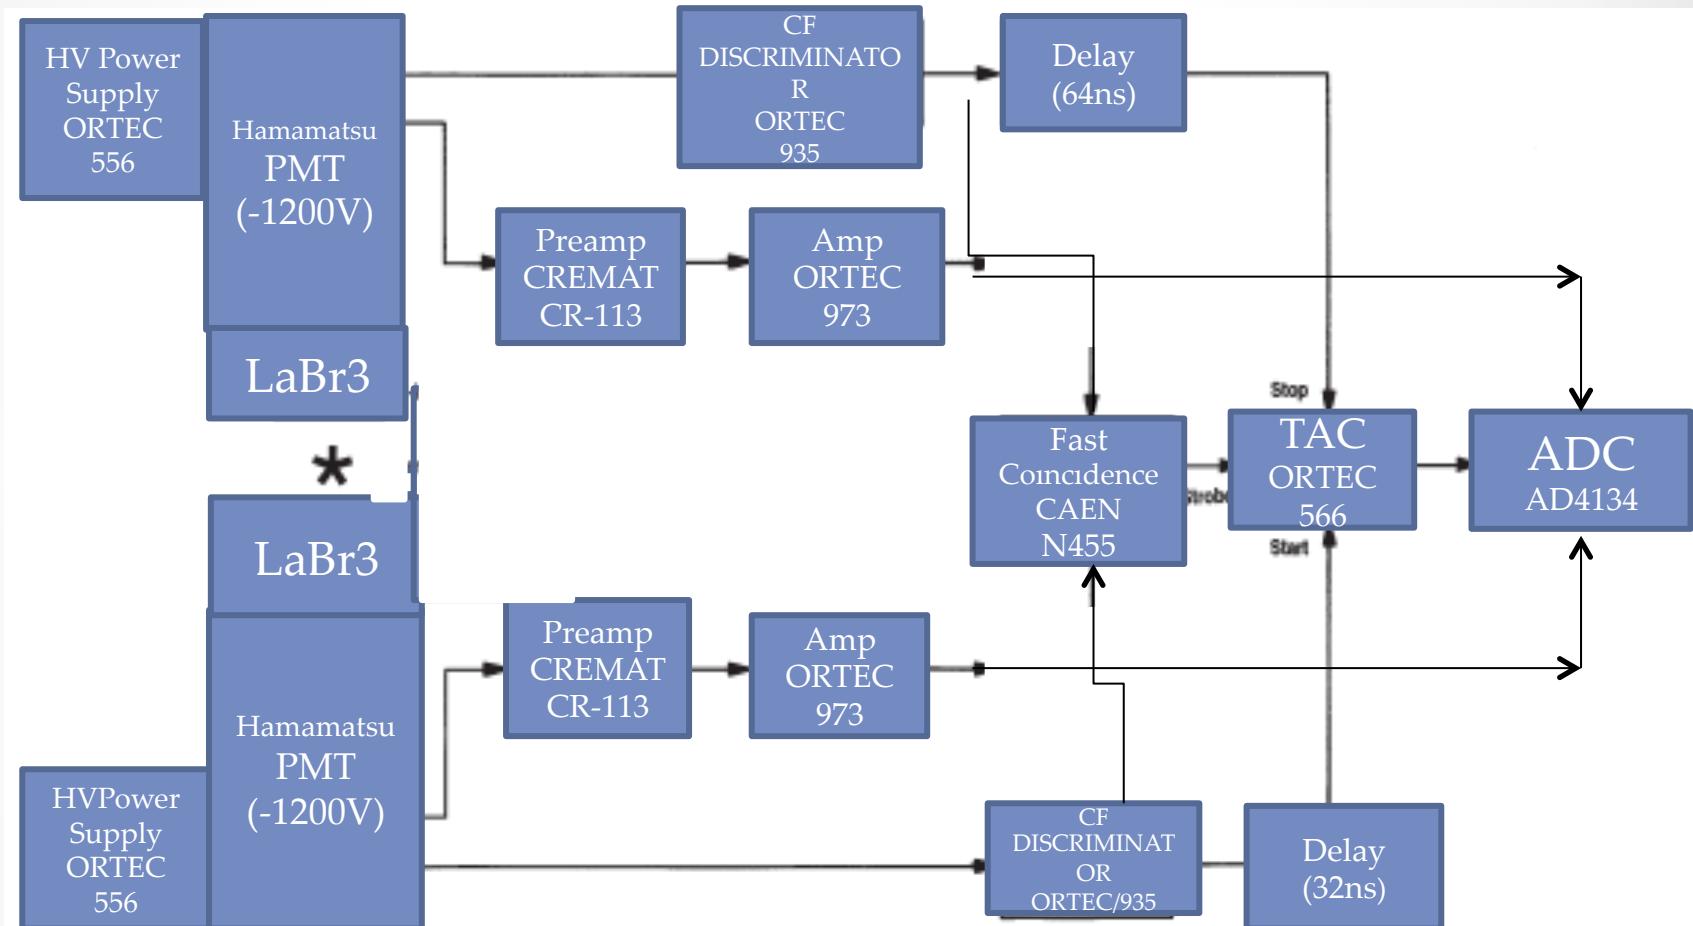

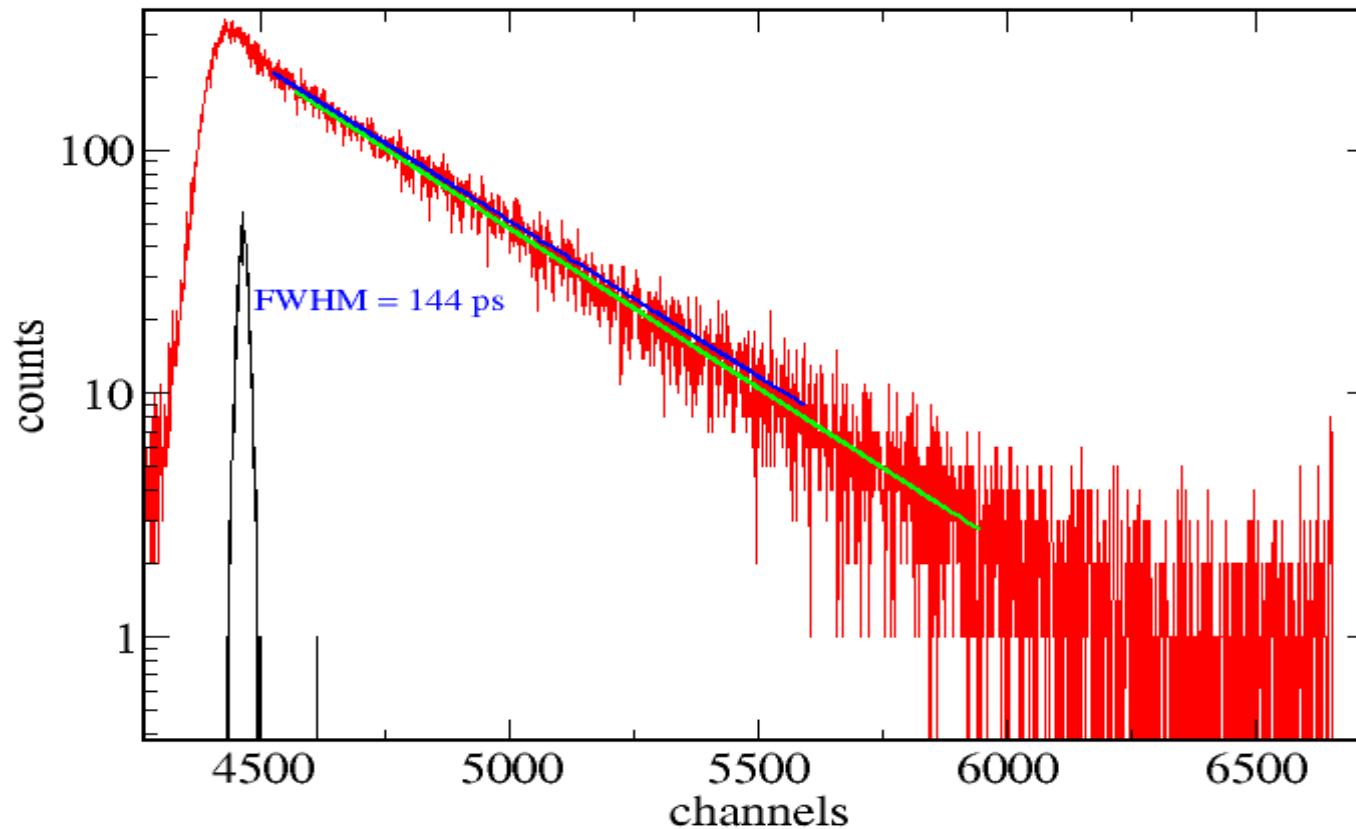

Fig. 5. Typical Fast/Slow Timing System for Gamma-Gamma Coincidence Measurements with Scintillators and Photomultiplier Tubes.

Conditions

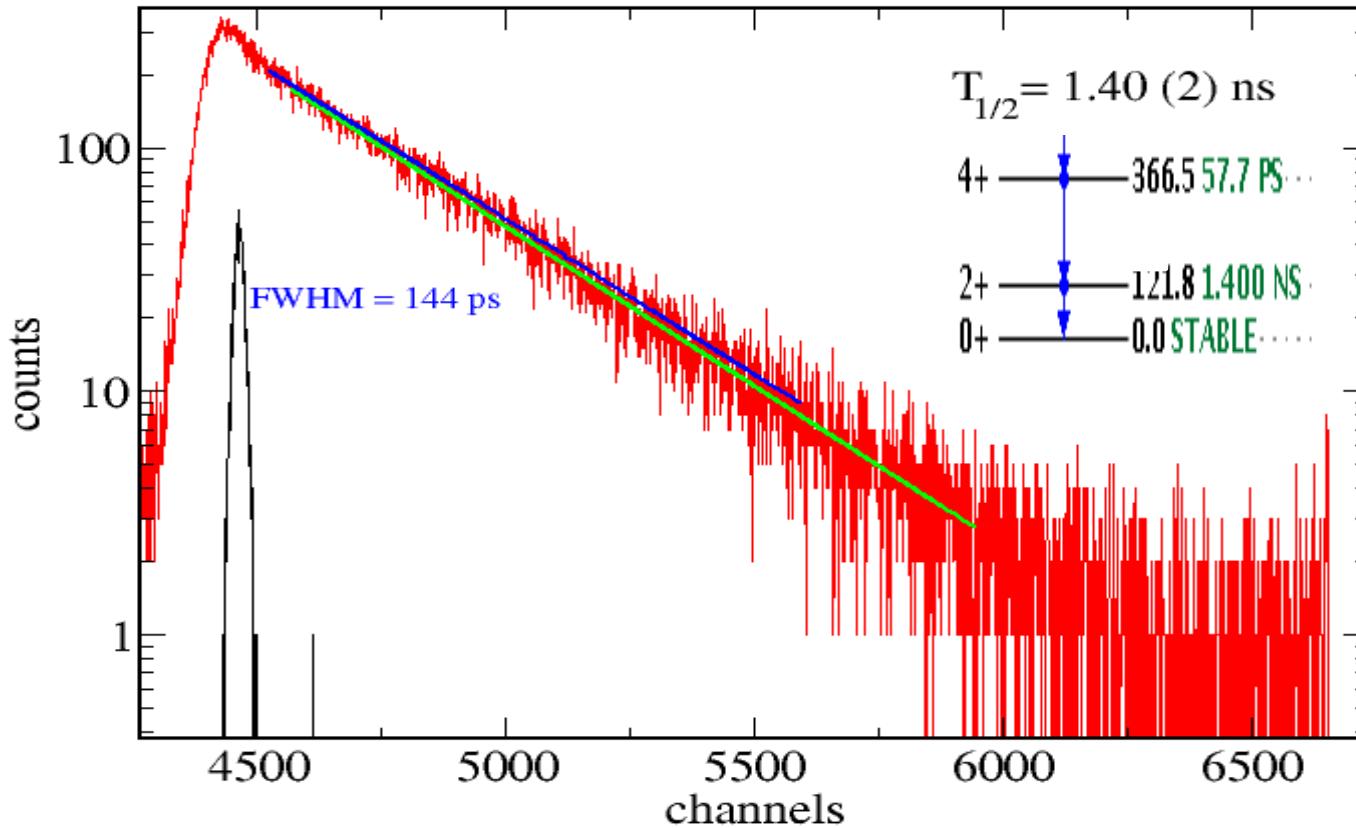

- Electronic gate – coincidence mode
- Software gate on energy peaks

Time spectrum of ${}^{152}\text{Eu}$

- Radioactivity law - $A=A_0 \exp(-\lambda t)$
- Mean value of life - $\tau=1/\lambda$
- Half-life – $T=\ln(2) \tau$
- $T=\ln(2)/\lambda$

RESULT

Literature $T_{1/2} = 1.43 \text{ ns}$

Conclusion

LaBr₃ detectors

- Fast detectors
- Relatively high energy resolution
- High time resolution
- Wires are the weakest part of every setup
